

Quarterly Field Report

This sample document ships with the anymd docs playground. It is converted entirely inside your browser by the same Rust engine that powers the anymd CLI and MCP server, compiled to WebAssembly.

Summary

Two-column layouts are a classic trap for PDF extractors: naive tools interleave lines from the left and right columns. anymd rebuilds words from glyph gaps, orders columns with an XY cut, and emits one clean paragraph per block.

Headings are inferred from font sizes, lists keep their bullets, and tables become compact pipe tables that cost fewer tokens than padded ones. Each page carries a marker so an agent can cite it.

Results by region

Region	Sites	Uptime	Change
North	42	99.95%	+0.20
South	37	99.87%	-0.05
East	18	99.99%	+0.40
West	25	99.91%	+0.10

Next steps

- Drop your own PDF, DOCX, PPTX, XLSX, EPUB, HTML, or CSV above.
- Install the CLI for OCR of scanned pages and audio/video transcripts.
- Use the MCP server to give an agent the same reader.

Files you drop are read with the File API and never leave this page.
